APPENDIX H – ALGORITHMIC AND AUTOMATED DECISION IMPACT ASSESSMENT

(To be completed only if applicable, as indicated by the Pre-Data Gathering Ethical Screening Checklist)

General Information
Title of Study:_____
Proponent(s): _____
Program / Department: _____
Course / Section (if applicable):_____
Faculty Adviser (if applicable): _____

Scope

This appendix applies to studies that involve:

- Artificial intelligence (AI) or machine learning models
- Algorithmic classification, ranking, scoring, or prediction
- Recommendation systems
- Behavioral analytics or profiling
- Simulation of user behavior where outputs may affect individuals

If the study only uses AI for internal technical testing without impact on individuals, this appendix may not be required. Student research projects must not deploy AI systems that make binding real-world decisions without safeguards, replace professional judgment in sensitive areas (e.g., medical, psychological, legal), or conduct covert profiling without consent.

If the study involves sensitive domains (e.g., health, mental health, academic performance), additional safeguards may be required.

I. Nature of Algorithmic Processing

1. Does the system use AI, machine learning, or automated algorithms?
   ☐ Yes ☐ No
2. The system performs (check all that apply):
   ☐ Pattern analysis
   ☐ Classification or categorization
   ☐ Ranking or scoring
   ☐ Prediction or forecasting
   ☐ Recommendation generation
   ☐ Behavioral inference
   ☐ Simulation only (no real-world output)

II. Impact on Individuals

1. Could the system's outputs affect individuals in any of the following ways?
   ☐ Academic evaluation
   ☐ Access to services or opportunities
   ☐ Reputation or standing
   ☐ Health or psychological assessment
   ☐ Employment or performance evaluation
   ☐ None – output is purely technical or experimental
2. Will the system be deployed in a real-world environment (outside simulation/testing)?
   ☐ Yes ☐ No (simulation or laboratory testing only)

III. Risk of Bias, Profiling, or Misclassification

1. Could the algorithm introduce bias or unfair treatment based on:
   ☐ Demographics (age, gender, socio-economic status, etc.)
   ☐ Behavioral patterns
   ☐ Small or unrepresentative datasets
   ☐ Inferred characteristics
   ☐ None identified
2. If risks are identified, describe mitigation measures:
   (e.g., dataset review, fairness checks, human validation, limiting decision authority)

IV. Human Oversight and Safeguards

1. Are automated outputs subject to human review before decisions are made?
   ☐ Yes ☐ No ☐ Not applicable (no real-world decision impact)
2. Will participants or users be informed that algorithmic processing is involved?
   ☐ Yes ☐ No ☐ Not applicable (no real-world decision impact)
3. Does the system provide explainable outputs or transparency mechanisms?
   ☐ Yes ☐ No ☐ Not applicable (no real-world decision impact)

V. Ethical Assurance

The proponents affirm that:

- The algorithmic or AI components are used responsibly and proportionately
- Risks of bias, profiling, or harm have been considered
- Appropriate human oversight is maintained where necessary
- The system will not be deployed beyond the approved research scope without further ethical review
- The study complies with institutional ethical standards and applicable national guidelines, including those set by the **Philippine Health Research Ethics Board (PHREB)**
